1. **Add a new course:**
   POST: http://assignment4jingyi-env.xjggtc3wpv.us-east-2.elasticbeanstalk.com/webapi/courses

   Because the boardId and rosterId in my project is long type. So they are 0 when you create a new course without giving those two attributes. And according to the requirement of Assignment3, the notificationTopic should not be null after adding course (automaticly).

   Add a new course:

   {

          "courseId":"Test",

          "professorId":"TestProfessor",

          "taId":"TestTa",

          "department":"TestDepartment"

   }

2. **My workflow view:**

3. **You can check whether the new registrar is created by** :

   GET: http://assginment4registrarjingyi-env.q34gfuqr4d.us-east-2.elasticbeanstalk.com/webapi/Registrars/allRegistrars

4. **You can check whether the course's boardId is updated by:**

   GET: http://assignment4jingyi-env.xjggtc3wpv.us-east-2.elasticbeanstalk.com/webapi/courses/{courseId}

   The boardId of this course will not be 0 anymore.
